⑳ New substituted azetidinones as anti-inflammatory and antidegenerative agents.

㉑ New substituted azetidinones of the general formula (A') which have been found to be potent elastase inhibitors and thereby useful anti-inflammatory and antidegenerative agents are described.

BACKGROUND OF THE INVENTION

We have found that a group of new substituted azetidinones are potent elastase inhibitors and therefore are useful anti-inflammatory and antidegenerative agents.

5 Proteases from granulocytes and macrophages have been reported to be responsible for the chronic tissue destruction mechanisms associated with inflammation, including rheumatoid arthritis and emphysema. Accordingly, specific and selective inhibitors of these proteases are candidates for potent anti-inflammatory agents useful in the treatment of inflammatory conditions resulting in connective tissue destruction, e.g. rheumatoid arthritis, emphysema, bronchial inflammation, glomerular nephritis, myocardiol  
10 infection/reperfusion injury osteoarthritis, spondylitis, lupus, psoriasis, atherosclerosis, sepsis, septicemia, shock, periodontitis, cystic fibrosis, myocardial infarction, reperfusion injury, meningitis, glomerulonephritis and acute respiratory distress syndrome.

The role of proteases from granulocytes, leukocytes or macrophages are related to a rapid series of events which occurs during the progression of an inflammatory condition:

15 (1) There is a rapid production of prostaglandins (PG) and related compounds synthesized from arachidonic acid. This PG synthesis has been shown to be inhibited by aspirin-related nonsteroidal anti-inflammatory agents including indomethacin and phenylbutazone. There is some evidence that protease inhibitors prevent PG production;  
20 (2) There is also a change in vascular permeability which causes a leakage of fluid into the inflamed site and the resulting edema is generally used as a marker for measuring the degree of inflammation. This process has been found to be induced by the proteolytic or peptide cleaving activity of proteases, especially those contained in the granulocyte, and thereby can be inhibited by various synthetic protease inhibitors, for example, N-acyl benzisothiazolones and the respective 1,1-dioxides. Morris Zimmerman et al., *J. Biol. Chem.*, 255, 9848 (1980); and  
25 (3) There is an appearance and/or presence of lymphoid cells, especially macrophages and polymorphonuclear leukocytes (PMN). It has been known that a variety of proteases are released from the macrophages and PMN, further indicating that the proteases do play an important role in inflammation.

In general, proteases are an important family of enzymes within the peptide bond cleaving enzymes whose members are essential to a variety of normal biological activities, such as digestion, formation and 30 dissolution of blood clots, the formation of active forms of hormones, the immune reaction to foreign cells and organisms, etc., and in pathological conditions such as the degradation of structural proteins at the articular cartilage/pannus junction in rheumatoid arthritis etc.

Elastase is one of the proteases. It is an enzyme capable of hydrolyzing the connective tissue component elastin, a property not contained by the bulk of the proteases present in mammals. It acts on a 35 protein's nonterminal bonds which are adjacent to an aliphatic amino acid. Neutrophil elastase is of particular interest because it has the broadest spectrum of activity against natural connective tissue substrates. In particular, the elastase of the granulocyte is important because, as described above, granulocytes participate in acute inflammation and in acute exacerbation of chronic forms of inflammation which characterize many clinically important inflammatory diseases.

40 Proteases may be inactivated by inhibitors which block the active site of the enzyme by binding tightly thereto. Naturally occurring protease inhibitors form part of the control or defense mechanisms that are crucial to the well-being of an organism. Without these control mechanisms, the proteases would destroy any protein within reach. The naturally occurring enzyme inhibitors have been shown to have appropriate configurations which allow them to bind tightly to the enzyme. This configuration is part of the reason that 45 inhibitors bind to the enzyme so tightly (see Stroud, "A Family of Protein-Cutting Proteins" *Sci. Am.* July 1974, pp. 74-88). For example, one of the natural inhibitors,  $\alpha_1$ -Antitrypsin, is a glycoprotein contained in human serum that has a wide inhibitory spectrum covering, among other enzymes, elastase both from the pancreas and the PMN. This inhibitor is hydrolyzed by the proteases to form a stable acyl enzyme in which the active site is no longer available. Marked reduction in serum  $\alpha_1$ -antitrypsin, either genetic or due to 50 oxidants, has been associated with pulmonary emphysema which is a disease characterized by a progressive loss of lung elasticity and resulting respiratory difficulty. It has been reported that this loss of lung elasticity is caused by the progressive, uncontrolled proteolysis or destruction of the structure of lung tissue by proteases such as elastase released from leukocytes. *J. C. Powers, TIBS*, 211 (1976).

55 Rheumatoid arthritis is characterized by a progressive destruction of articular cartilage both on the free surface bordering the joint space and at the erosion front built up by synovial tissue toward the cartilage. This destruction process, in turn, is attributed to the protein-cutting enzyme elastase which is a neutral protease present in human granulocytes. This conclusion has been supported by the following observations:

(1) Recent histochemical investigations showed the accumulation of granulocytes at the cartilage/pannus

junction in rheumatoid arthritis; and

(2) a recent investigation of mechanical behavior of cartilage in response to attack by purified elastase demonstrated the direct participation of granulocyte enzymes, especially elastase, in rheumatoid cartilage destruction. Enzyme Assays for the Inhibition of Human Polymorphonuclear Leukocyte Elastase Via Hydrolysis of N-t-Boc-alanyl-alanyl-prolylalanine-p-nitroanilide (Boc-AAPAN) or N-t-Boc-alanyl-prolylvaline-p-nitroanilide (Boc-AAPVN) Reagent:

55

0.05M TES (N-tris[hydroxymethyl]methyl-2-amino-ethanesulfonic acid) Buffer, pH 7.5.

0.2 mM Boc-AAPAN or Boc-AAPVN.

To prepare substrate, the solid was first dissolved in 10.0 ml DMSO. Buffer at pH 7.5 was then added to a final volume of 100 ml.

Crude extract of human polymorphonuclear leukocytes (PMN) containing elastase activity.

Inhibitors (azetidinones) to be tested dissolved in DMSO just before use.

To 1.0 ml of 0.2 mM Boc-AAPAN in a cuvette, 0.01-0.1 ml of DMSO with or without inhibitor was added.

After mixing, a measurement was taken at 410 m $\mu$  to detect any spontaneous hydrolysis due to presence of 5 test compound. 0.05 Milliliters of PMN extract was then added and the  $\Delta$ OD/min at 410 m $\mu$  was measured and recorded. Beckman model 35-spectrophotometer was used.

Results in Table I were reported as ID<sub>50</sub>, effective dosage in micrograms per milliliter ( $\mu$ g/ml) for 50% inhibition of the enzyme activity 2 minutes after zero time.

Results were also expressed as Ki, the micromolar concentration of the inhibitor ( $\mu$ M) giving 50% of the 10 control enzyme activity; or as  $k_{obs}/l$  which is the second order rate constant in per mole per second for inactivation of the enzyme.

The elastase activity in the crude PMN extract may vary from one preparation to another. A control of each new batch is run, and the volume added in the assay procedure is adjusted according to activity.

For treatment of inflammation, fever or pain, the compounds of Formula (I), Formula A or Formula A' may be administered orally, topically, parenterally, by inhalation spray or rectally in dosage unit formula-

tions containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques. In addition to the treatment of warm-blooded animals such as mice, rats, horses, dogs, cats, etc., the compounds of the invention are effective in the treatment of humans.

5 The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparation. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed.

20 Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

25 Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyoxyethylene sorbitan monooleate. The said aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

30 Oily suspension may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an antioxidant such as ascorbic acid.

35 Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

40 The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oils, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

45 Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents. The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile

injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution glucose in water and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

5 The compounds of Formula (I), Formula A and Formula A' may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal 10 temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, creams, ointments, jellies, solutions or suspensions, etc., containing the anti-inflammatory agents are employed.

15 The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. For example, a formulation intended for the oral administration of humans may contain from 5 mg to 2000 mg or 5000 mg of active agent compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95 percent of the total composition. For purposes of this specification, this broad dosage range is specifically intended to include, but is not limited to, range of 5 mg 20 to 2000 mg; 25 mg to 2000 mg; 5 mg to 1000 mg; 25 mg to 1000 mg; 5 mg to 500 mg; and 25 mg to 500 mg. Dosage unit forms will generally contain between from about 25 mg to about 500 mg of active ingredient.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general 25 health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

The following example illustrates the preparation of the compounds useful in the method of treatment of the present invention, but does not limit the scope of the invention.

To this mixture (at 35 °C) was added the material prepared above in Example 24, Method B, Step B (3.15kg of  $\beta$ -lactam). The resulting mixture was cooled and stirred at 30 - 31 °C for 1 hr, followed by stirring at 18 °C for an additional hr before being quenched by the addition of 2N HCl (15L) and EtOAc (15L). The layers were separated and the aqueous phase (pH 8.2) was further extracted with EtOAc (18L). The combined organic layers were washed successively with sat. This oil was dissolved in EtOAc (935 mL) and treated with (S)-(-)- $\alpha$ -methylbenzylamine as described above for the crystallization of the unwanted isomer with (R)-(+)- $\alpha$ -methylbenzylamine. ##### (R)- $\alpha$ -Allyl-4-methylbenzyl isocyanate

###### 30 Method A:

###### Step A: Preparation of (R)- $\alpha$ -allyl-4-methylphenyl-benzylamine, L-pyroglutamic acid salt

35 A solution of lithium bistrimethylsilylamide was prepared as follows. To hexamethyldisilazane (4.04 Kg, 5.28 L, 25 mol) was added anhydrous THF (4 L). The solution was cooled to -5°C and n-BuLi (2.4 M in hexanes, 9.7 L) was added over a period of 1.5 hr, while maintaining the reaction temperature between -5 and 0°C. The mixture was then aged for 10-15 min, allowed to rise to room temperature and stored under N<sub>2</sub> overnight.

40 A solution of p-tolualdehyde (2.91 Kg, 24.27 mol) in THF (10 L) was cooled under N<sub>2</sub> to -8°C and the solution of lithium bistrimethylsilylamide prepared above was added via an addition funnel, while maintaining the reaction temperature between -8 and 0°C. The mixture was then warmed to 10°C and allylmagnesium chloride (2 M, 12.5 L, 25 mol) was added, while maintaining the temperature between 15 - 20°C. After aging for 15 min the reaction mixture was cooled to 10°C and transferred to a larger vessel containing H<sub>2</sub>O (85 L) and NH<sub>4</sub>Cl (12 Kg) at 10°C. An additional 5 L of THF was used to complete the transfer and the quench mixture exothermed to 25°C during the transfer. After stirring for 30 min the lower aqueous layer separated and was removed. The organic layer was washed with brine (20 L) and then the bulk solvent was removed in *vacuo* at 30 - 35°C and the remaining solution (8 - 10 L) was dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to give the product racemic amine in quantitative yield.

50 This racemate (3.95 Kg, 23.8 mol) was dissolved in EtOAc (40 L) and this solution was added to a solution (warming to 50°C was necessary to effect complete dissolution) of L-pyroglutamic acid (1.84 Kg, 14.26 mol) in methanol (8 L). The mixture was heated to reflux and solvent (20 L) was distilled from the vessel. EtOAc (30 L) was added and more solvent (30 L) was distilled off. A further charge of EtOAc (40 L) was added and the reaction mixture was concentrated to 39 L. The mixture was allowed to cool to 65°C and seeded before being allowed to cool further (to 50°C over 30 min) to form a thick slurry. The slurry was then reheated to reflux and aged for 30 min. After cooling to room temperature over 1 hr, and further aging at 15°C for 1 hr, the amine salt was filtered, washed with EtOAc (3 L) and dried in *vacuo* at 50°C. This material was recrystallized from EtOAc (23 L), filtered, washed successively with EtOAc (2 x 2 L) and Et<sub>2</sub>O (1

L) and then dried in vacuo overnight at 50°C to give the title amine salt with an R:S ratio (GC of menthyl carbamate derivatives) of 95:5.

Step B: (R)- $\alpha$ -Allyl-4-methylbenzyl isocyanate

5 The amine salt prepared above in Example 28, Method A, Step A (2.655 Kg) was dissolved in a mixture of t-butylmethyl ether (7.38 L) and H<sub>2</sub>O (7.38 L) and 5M NaOH (3 L) was added. This mixture was stirred for 15 min and the aqueous layer was separated and re-extracted with t-butylmethyl ether (7.38 L). The pooled organic extracts were washed with brine (2 x 4 L), dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and evaporated to dryness to give the free amine (1.5 Kg) as a mobile liquid. This material was dissolved in EtOAc (8.66 L) and cooled to 0 - 5°C and to this was added a solution of EtOAc/HCl (prepared separately by adding absolute EtOH (1.062 L) dropwise over 50 min to an ice cold solution of acetyl chloride (1.298 L) in EtOAc (3.54 L), while maintaining the temperature below 10°C during the addition) dropwise over 50 min, maintaining the temperature below 20°C. The resulting amine hydrochloride slurry was heated to 70°C and a solution of 1.93M phosgene in toluene (11 L, 21.1 mol) was added over 1.75 hr at this temperature. The resulting solution was heated at 70°C for a further 1.75 hr and then cooled to room temperature. A mixture of brine (6 L) and H<sub>2</sub>O (6 L) was added and the mixture allowed to separate. The organic phase was washed successively with saturated NaHCO<sub>3</sub> solution (2 x 10 L) and brine (10 L) before being dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to give the title compound as a mobile liquid.

Method B:

Step A: Preparation of (R)- $\alpha$ -allyl-4-methylbenzylamine

25 A solution of lithium bistrimethylsilylamine was prepared by adding 208 ml of 2.5M n-BuLi to a solution of bistrimethylsilylamine (110 ml, 0.52 mol) in THF (140 ml) at 0°C. After stirring for 15 min, this solution was added via a cannula to a solution of p-tolualdehyde (59 ml, 0.5 mol) in THF (100 ml), while keeping the temperature between -40 and -50°C. The reaction mixture was then allowed to warm up to 10°C over 30 min. A 2M solution of allyl magnesium chloride (260 ml) in THF was added, keeping the temperature of the reaction between 10 and 15°C. After stirring for 30 min the reaction was poured into a solution prepared by dissolving NH<sub>4</sub>Cl (150 gm) in H<sub>2</sub>O (1 liter). The layers were separated and the aqueous layer was extracted with Et<sub>2</sub>O - hexane. The organic layer was washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated to dryness. The residual oil was added to a solution of (1R)-(-)-10-camphorsulfonic acid (62.5 gm) in EtOAc (1 liter) with cooling. On standing overnight at room temperature, crystals were formed and these were filtered off and washed with EtOAc. The solid was stirred with refluxing EtOAc (300 ml), filtered and washed again with EtOAc. The pure product so formed weighed 60.7 gm (59%). [α]<sub>D</sub> -27.16 (c = 0.5, EtOH).

Step B: (R)- $\alpha$ -allyl-(4-methylphenyl)methyl isocyanate

40 A slurry of 50 gm (0.122 mol) of material prepared as described above in Step A was added to 2N NaOH (75 ml) and Et<sub>2</sub>O (150 ml). After stirring for 5 min the layers were separated and the aqueous layer was extracted with Et<sub>2</sub>O. The pooled organic layers were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness.

45 A 3-necked flask equipped with a gas inlet tube, a condenser, and an addition funnel without sidearm was charged with EtOAc (100 ml) and this was heated on a 60°C bath while phosgene gas was bubbled through the solution. A solution of the amine obtained above in 20 ml of EtOAc was added dropwise at a rate such that the white solid did not build up in the reaction mixture. Phosgene was continued for 5 additional minutes after all the amine had been added and the solution was clear. The bath was then heated to 110°C and EtOAc was removed by distillation. The title compound was so obtained as a yellow residue (24.99 gm) and was used without further purification.

Step A: Preparation of (4S)-3,3-Diethyl-1-[(R)- $\alpha$ -allyl-(4-methyl)benzylaminocarbonyl]-4-[4-(benzyloxycarbonylmethyl)phenoxy]azetidin-2-one

To a vessel charged with DMF (14.23 L) was added the material prepared above in Example 27 (2.845 Kg, 7.74 mol) and the material prepared above in Example 28, Method A (8.17 mol). Ground, anhydrous  $K_2CO_3$  (108 gm, 0.78 mol) was added and the resulting mixture was stirred at room temperature, under  $N_2$ , for 2.5 hr. The reaction mixture was then diluted with EtOAc (25 L) and stirred with  $H_2O$  (25 L) for 5 min.

5 The layers were separated and the organic layer was washed with  $H_2O$  (25 L). An emulsion formed which was broken up by the addition of saturated brine (5 L) and the organic layer was further washed with  $H_2O$  (2 x 20 L). Again emulsions were formed and this time they were broken up by the addition of t-butylmethyl ether (10 L). A solution of 2-amino-2-methyl-1-propanol (670 gm) in t-butylmethyl ether (13 L) was added over 20 min at room temperature. The solution was seeded and the resulting slurry was stirred at room temperature overnight. The mixture was then chilled at 0 °C for 1 hr, filtered, washed with t-butylmethyl ether (12 L) and dried *in vacuo* at room temperature. This product was recrystallized twice from EtOAc to give the title compound

25 (3.159 Kg) as a crystalline white powder. m.p. 138.5 - 140 °C.

EXAMPLE 31

(R)-5-[(1-Isocyanate)butan-1-yl]benzofuran

50 Step A: Preparation of (4-Bromo-2-formyl)phenoxyacetic acid, monohydrate

To a solution of 5-bromosalicylaldehyde (5kg) in THF (12.1L) at 40 °C under a  $N_2$  blanket was added a solution of bromoacetic acid (3.8kg) in  $H_2O$  (50L). This mixture was stirred at 40 °C and a solution of NaOH (2.09kg) in  $H_2O$  (8.1L) was added over 20 min. The deep red solution so formed was warmed to gentle reflux for 18 hr. THF (approx. 7L) was then distilled from the reaction mixture at atmospheric pressure and the resultant yellow solution was cooled to room temperature. The pH was then adjusted to 8 ± 0.2 by the addition of sat.  $NaHCO_3$  solution and the resultant mixture was extracted with isopropylacetate (2 x 15L).

The aqueous layer was acidified to pH 3 ± 0.2 with conc. HCl (2.4L) and the resultant slurry was aged at 20°C for 1 hr and the product was then filtered off, washing the pad with H<sub>2</sub>O (7L) to give the title compound as a pale yellow solid (3.77kg).

5 Step B: Preparation of 5-bromobenzofuran

A slurry of the material prepared above in Example 31, Step A (3.70kg) and sodium acetate (7.40kg) in acetic acid (18.5L) was heated to gentle reflux under a N<sub>2</sub> blanket and acetic anhydride (7.4L) was then added dropwise over 6 hr. This mixture was then heated at reflux until HPLC indicated no remaining starting material. The reaction was then cooled to 80°C and H<sub>2</sub>O (11.1L) was added dropwise over 1 hr. The mixture was then reheated to gentle reflux for 1 hr, cooled to 25°C, and transferred to a separating funnel. H<sub>2</sub>O (15L) and hexane (15L) were added and the phases separated. The lower layer was re-extracted with hexane (15L) and the combined organic extracts were washed successively with H<sub>2</sub>O (2 x 10L) and sat. NaHCO<sub>3</sub> (15L) before being dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to give the title compound, 2.40kg.

Step C: Preparation of 5-formylbenzofuran

A slurry of powdered magnesium (11.44g) and iodine (0.12g) in THF (120mL) was heated to 50°C under a N<sub>2</sub> blanket for 0.5 hr. A 30mL portion of the material prepared above in Example 31, Step B (90g) in THF (225mL) was then added at 50°C, without stirring. This mixture was aged for 0.5 hr and then the remaining 195mL of the THF solution was added over 1.5 hr (with stirring) while maintaining a gentle reflux. When the addition was complete, the mixture was aged at 50°C for 1 hr and then was cooled to 5°C before DMF (45mL) was added dropwise over 30 min while maintaining the reaction temperature between 5 - 10°C. The mixture was then aged at 10°C for 1 hr and then cooled to 5°C before a mixture of 3N HCl (300mL) and a 50% sat. solution of brine (225mL) was added while maintaining the reaction temperature below 15°C. The pH was also monitored and when the pH of the aqueous layer had fallen to 6, EtOAc (200mL) was added and the remaining 3N HCl / brine mixture was added (final pH approx. 1.2). This mixture was stirred for 1 hr and the aqueous layer was removed and extracted with EtOAc (150mL). The combined organic layers were washed successively with 2N HCl (100mL) and brine (3 x 80mL), dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to give 63.6g of the title compound as an orange oil that was of sufficient purity for use in the next step.

Step D: Preparation of (S)-1-(benzofuran-5-yl)-1-butanol

To a solution of (R,R)-di-(trifluoromethylsulfonyl)-1,2-diaminocyclohexane (1.92g) in dry toluene (80mL) at 23°C under a N<sub>2</sub> blanket was added titanium tetraisopropoxide (15mL) and the slurry was warmed to 40°C for 20 min, and then was cooled to 0°C. In a separate vessel di-n-propylzinc (52mL) was mixed with dry hexane (400mL) and the resulting homogeneous solution was added to the solution prepared above while maintaining the temperature between -5 - 0°C. This mixture, at 0°C, was then added to a solution of the material prepared above in Example 31, Step C (40g) in toluene (150mL) over 30 min. The resulting yellow mixture was then stirred at 0°C for 18 hr and then was cooled to -5°C and quenched by the addition of 2N HCl (500mL) over 1.5 hr, while maintaining the reaction temperature between -5 - 0°C. The resulting two phase mixture was stirred at 0°C for 1.2 hr and EtOAc (100mL) was added. The aqueous layer was removed and extracted with EtOAc (150mL). The combined organic layers were washed successively with 2N HCl (100mL) and brine (2 x 150mL) and then were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to afford 50g of a yellow oil which solidified on standing. The optical purity of this material is 95.5% ee.

50 Step E: Preparation of (R)-1-amino-1-(benzofuran-5-yl)-butane

To a solution of triphenylphosphine (132.3g) in THF (960mL) at 0°C was added ethyl azodicarboxylate (79.2mL). The resulting solution was stirred at 0°C until a thick slurry was obtained and then diphenyl-phosphoryl aside (54.2mL) was added. To this mixture was added a solution of the material prepared above in Example 31, Step D (47.7g) in THF (125mL) over a 1.5 hr time period while maintaining the reaction temperature between -3 - -2°C, and the resulting homogeneous solution was stirred at 0°C for 0.5 hr. To this mixture was added triphenylphosphine (96.2g) and the solution was allowed to warm to 23°C over 1 hr and then was heated at 50°C for 2.5 hr. 20% Aqueous NaOH (580mL) was then added to the mixture which

was stirred at 50°C for an additional 1 hr. The two phases mixture was cooled to 23°C and the lower aqueous layer was separated and extracted with THF (300mL). The combined organic layers were washed with brine (2 x 500mL) and then concentrated in vacuo to give 460g of an orange oil which was dissolved in t-butylmethyl ether (1L) and allowed to stand for 18 hr. The solid which formed was filtered off and washed with t-butylmethyl ether (100mL) and the filtrate was concentrated to dryness to afford 302g of an orange oil which was purified by silica gel chromatography (1.5kg column developed successively with hexane:EtOAc (1:1, 8L), EtOAc (4L) and then EtOAc containing 1% Et<sub>3</sub>N). Fractions containing the required product (and triphenylphosphine oxide) were pooled and evaporated to dryness. The oily residue so obtained was swished with hexane:EtOAc (5:1, 200mL) and filtered. The filtrate was concentrated in vacuo to afford 35.3g of an oil which was dissolved in EtOAc (80mL) and washed with 2N HCl (2 x 45mL). The pooled aqueous layers were cooled to 5°C and treated with 50% NaOH (20mL) before being extracted with Et<sub>2</sub>O (2 x 50mL). The combined organic layers were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to afford 20.3g of the title compound as an orange oil with an optical purity of 88% ee.

15 Step F: Preparation of (R)-5-[(1-isocyanate)butan-1-yl]benzofuran

16 To a solution of the material prepared above in Example 31, Step E (19.2g) in toluene (192mL) was added conc. HCl (12.7mL) dropwise, while maintaining the reaction temperature between 20 - 25°C. The white viscous slurry was stirred for 30 min at 20°C and then toluene (200mL) was added and the slurry was heated at reflux with the azeotropic removal of water. The dried slurry was then cooled to 100°C and a solution of phosgene in toluene (1.93M, 150mL) was added slowly over 1 hr. Complete solution was obtained after 1 additional hr. This solution was cooled to 10°C and sat. NaHCO<sub>3</sub> (200mL) was added followed by EtOAc (300mL). The organic layer was separated and washed successively with sat. EXAMPLE 32

(4S)-3,3-Diethyl-1-[[*(R*)-1-(benzofuran-5-yl)butylamino]carbonyl]-4-[4-(carboxymethyl)phenoxy]azetidin-2-one

30 Method A:

Step A: Preparation of ethyl 4-[(2,2-diethoxy)ethoxy]phenylacetate

35 To a solution of 4-hydroxyphenylacetic acid (50.0 gm, 0.33 mol) in DMSO (300 mL) was added 50% aqueous NaOH (57.0 gm, 0.71 mol) with stirring. After stirring for 10 min at room temperature bromoacetaldehyde diethyl acetal (66.0 gm, 0.33 mol) was added. The solution was heated at 100-110°C for 2 hr when an additional 2 gm of 50% NaOH was added. After heating for another hour the reaction mixture was cooled and poured into a mixture of aqueous HCl (30 mL of conc. HCl in 400 mL ice-H<sub>2</sub>O) and Et<sub>2</sub>O. The layers were separated and hexane was added to the Et<sub>2</sub>O layer. The organic layer was washed successively with H<sub>2</sub>O (twice) and saturated NaCl before being dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to give 83.7 gm (0.31 mol) of 4-[(2,2-diethoxy)ethoxy]phenylacetic acid which was suitable for use in the next step. NMR (CDCl<sub>3</sub>), δ from TMS: 1.25 (t, 6H, J = 7Hz), 3.56 - 3.90 (m, 4H), 3.61 (s, 2H), 4.03 (d, 2H, J = 7Hz), 4.86 (t, 1H, J = 7Hz), 6.91 (d, 2H, J = 8Hz), 7.21 (d, 2H, J = 8Hz).

45 The residue prepared above was dissolved in EtOH (500 mL) containing conc. H<sub>2</sub>SO<sub>4</sub> (1 mL) and the solution was heated under reflux for 6 hr. The reaction mixture was then cooled, concentrated to 300 mL and this solution was partitioned between H<sub>2</sub>O and Et<sub>2</sub>O. The aqueous layer was extracted with Et<sub>2</sub>O and the pooled organic layers were washed successively with H<sub>2</sub>O, sat. NaHCO<sub>3</sub>, and sat. NaCl before being dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to give 86.0 gm (0.29 mol), of the title compound. NMR (CDCl<sub>3</sub>), δ from TMS: 1.25 (t, 9H, J = 7Hz), 3.55 - 3.90 (m, 4H), 3.56 (s, 2H), 4.02 (d, 2H, J = 7Hz), 4.16 (q, 2H, J = 7Hz), 4.86 (t, 1H, J = 7Hz), 6.89 (d, 2H, J = 8Hz), 7.20 (d, 2H, J = 8Hz).

Step B: Preparation of ethyl benzofuran-5-ylacetate

55 In a 1 L 3-necked flask equipped with a mechanical stirrer and a condenser was added polyphosphoric acid (80 gm) and benzene (450 mL). This mixture was heated to reflux for 15 min and then ethyl 4-[(2,2-diethoxy)ethoxy]phenylacetate (86 gm, 0.29 mol) in benzene (50 mL) was added and the reflux was continued for 40 min. The reaction mixture was cooled and the mobile phase was decanted off. This

benzene solution was washed successively with  $\text{H}_2\text{O}$ , sat.  $\text{NaHCO}_3$ , and sat.  $\text{NaCl}$  before being dried over  $\text{Na}_2\text{SO}_4$ , filtered and evaporated to dryness. This residue was dissolved in 10-15%  $\text{EtOAc}$  in hexane and passed through a short silica gel column (5 cm x 10 cm dia.) in the same solvent. The eluent was evaporated to dryness to give a yellow liquid which was further purified by preparative LC using 10%  $\text{EtOAc}$

5 in hexane as eluent to give 17.4 gm of ethyl benzofuran-5-ylacetate.

NMR ( $\text{CDCl}_3$ ),  $\delta$  from TMS: 1.26 (t, 3H,  $J$  = 7Hz), 3.70 (s, 2H), 4.19 (q, 2H,  $J$  = 7Hz), 6.75 (m, 1H), 7.2 - 7.7 (m, 4H).

Step C: Preparation of (R,S)- $\alpha$ -Allylbenzofuran-5-ylacetic acid

10

Ethyl benzofuran-5-ylacetate (17.42 gm, 0.085 mol) was dissolved in dry THF (120 mL) and the solution was cooled under a nitrogen blanket in a dry ice bath. After 10 min, a solution of 1 M lithium bis(trimethylsilyl)amide in THF (90 mL) was added via an addition funnel over a 15 min time period. After stirring for 15 min, allyl bromide (7.9 mL, 11.04 gm, 0.091 mol) was added and the stirred solution was allowed to rise to room temperature over 1 hr. The solution was poured into ice- $\text{H}_2\text{O}$  containing 20 mL of 1.2N HCl and extracted with  $\text{Et}_2\text{O}$ . The organic layer was washed successively with 1.2N HCl and sat.  $\text{NaCl}$  before being dried over  $\text{Na}_2\text{SO}_4$ , filtered and evaporated to dryness to give 21.6 gm of crude ethyl (R,S)- $\alpha$ -allylbenzofuran-5-ylacetate.

15

The ethyl (R,S)- $\alpha$ -allylbenzofuran-5-ylacetate obtained above was dissolved in  $\text{EtOH}$  (200 mL) and treated with  $\text{H}_2\text{O}$  (30 mL) and 5N NaOH (30 mL). This solution was heated at 60°C for 1.5 hr, stirred overnight at room temperature and then heated at 60°C for an additional 1 hr before being worked up. The reaction mixture was cooled and poured into ice- $\text{H}_2\text{O}$  (400 mL) containing conc. HCl (14 mL) and  $\text{Et}_2\text{O}$ . The layers were separated and the aqueous layer was further extracted with  $\text{Et}_2\text{O}$ . The pooled  $\text{Et}_2\text{O}$  layers were washed successively with  $\text{H}_2\text{O}$  and sat.  $\text{NaCl}$ , dried over  $\text{Na}_2\text{SO}_4$ , filtered and evaporated to dryness to give 16.88 gm of (R,S)- $\alpha$ -allylbenzofuran-5-ylacetic acid which solidified on standing.

20

NMR ( $\text{CDCl}_3$ ),  $\delta$  from TMS: 2.58 (m, 1H), 2.84 (m, 1H), 3.72 (m, 1H), 5.00 - 5.20 (m, 2H), 5.64 - 5.84 (m, 1H), 6.74 (m, 1H), 7.20 - 7.70 (m, 4H).

Step D: Preparation of (R)- $\alpha$ -allylbenzofuran-5-ylacetic acid, (R)-(+)- $\alpha$ -methylbenzylamine salt

25

To a solution of the racemate prepared above in Example 32, Method A, Step C (39.43 gm, 0.18 mol) in  $\text{iPrOH}$  (285 mL) was added (R)- $\alpha$ -methylbenzylamine (14.4 gm, 0.12 mol). A solid formed immediately and the mixture was allowed to stand at room temperature for 1 hr. The solid was filtered off, washed with cold  $\text{iPrOH}$  and dried. This solid ( $\alpha_D$  = -4.55) was recrystallized from  $\text{iPrOH}$  (750 mL) to give 26.9 gm of material with  $\alpha_D$  = -14.1. An additional recrystallization from  $\text{iPrOH}$  (800 mL) gave 20.3 gm (0.06 mol) of product with  $\alpha_D$  = -22.61 which was suitable for use in the next step.

30

Note that the mother liquors from these crystallizations can be racemized (via conversion to the free acid and esterification, followed by successive treatments with lithium bis(trimethylsilyl)amide, acetic acid and then de-esterification with NaOH in MeOH) and then resolution of this material can be realized as described above. In this fashion the bulk of the racemate can be converted into the required enantiomer.

35

Step E: Preparation of (R)- $\alpha$ -allylbenzofuran-5-ylmethyl isocyanate

40

The material prepared above in Example 32, Method A, Step D (20.3 gm, 0.06 mol) was added to 2N HCl (35 mL) in a mixture of ice- $\text{H}_2\text{O}$  (150 mL) and  $\text{Et}_2\text{O}$  (150 mL). This mixture was stirred for a few minutes until the solid dissolved and the layers were then separated and the aqueous layer was extracted with  $\text{Et}_2\text{O}$ . The  $\text{Et}_2\text{O}$  layer was washed with sat.  $\text{NaCl}$ , dried over  $\text{Na}_2\text{SO}_4$ , filtered and evaporated to dryness. The residue so obtained was dissolved in  $\text{CH}_2\text{Cl}_2$  (200 mL) and 25 drops of DMF were added. This solution was cooled in an ice bath and a solution of oxalyl chloride (5.5 mL, 0.063 mol) in  $\text{CH}_2\text{Cl}_2$  (20 mL) was added over a 10 min period. The reaction mixture was stirred for 1 hr (gas evolution stopped after approximately 45 min) and then was evaporated to dryness. The residue so obtained was dissolved in acetone (120 mL) and the solution was added to a cooled (ice bath) solution of  $\text{NaN}_3$  (4.11 gm, 0.063 mol) in  $\text{H}_2\text{O}$  (80 mL) while maintaining the temperature between 2-5°C. After the addition was completed, the reaction was stirred for 30 min and then poured into a mixture of ice- $\text{H}_2\text{O}/\text{CHCl}_3$ . The layers were separated and the aqueous layer was extracted with  $\text{CHCl}_3$ . The pooled organic layers were washed with cold  $\text{H}_2\text{O}$  and sat.  $\text{NaCl}$  before being dried over  $\text{Na}_2\text{SO}_4$ , filtered and concentrated to 250 mL. This solution was heated in an oil bath at 60°C for 30 min (gas evolution ceased) and then was evaporated to dryness. The residue so obtained was dried by azeotropic concentration from a benzene solution (150 mL) and then was

stored in the freezer overnight as a benzene solution before being used in the next step. Upon evaporation to dryness, this solution contained 12.8 gm (0.06 mol) of product.

This was filtered and the filtrate was concentrated to 150 mL, diluted with  $H_2O$  (100 mL) and then lyophilized to give the required product as a hygroscopic white solid which analysed as a hydrate. Optical rotation  $\alpha_D$  (c = 0.49, MeOH) = +55.31;

Step B: Preparation of benzofuran-5-ylacetic acid

40 1.20 gm (6.3 mmol) of material prepared as described in Step A above was treated with 2N NaOH (6.5 ml) and MeOH (10 ml) at room temperature for 3 hr. The reaction mixture was then diluted with H<sub>2</sub>O and the resultant solution was washed with Et<sub>2</sub>O. The aqueous layer was acidified and extracted twice with EtOAc. The combined EtOAc layers were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness to give 1.1 gm (6.25 mmol) of the title compound suitable for direct use in the next step.

Step C: Preparation of (R)- $\alpha$ -allyl-benzofuran-5-ylacetic acid, (R)-(+)- $\alpha$ -methylbenzylamine salt (alternate route to that described in Example 32 Method A, Step D

50 10.0 gm (56.76 mmol) of material prepared as described in Step B above was dissolved in THF (300 ml) and added dropwise over 15 min to a cold (-5 to -10 °C) solution of lithium diisopropylamine [prepared from diisopropylamine (20.45 ml, 141.88 mmol) and 2.5M n-BuLi (48 ml, 120 mmol)] in THF. The reaction mixture was stirred at -10 °C for 30 min and then a solution of allyl bromide (10.81 ml, 113.52 mmol) in THF (20 ml) was added quickly. This mixture was stirred at -10 °C for 30 min and then cooled and added to a mixture of ice-H<sub>2</sub>O (900 ml), 2N HCl (300 ml) and Et<sub>2</sub>O (500 ml). After stirring for 5 min the layers were separated and the aqueous layer was washed with Et<sub>2</sub>O (100 ml) and the pooled organic layers were washed successively with aqueous NaHSO<sub>3</sub> and brine and then dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness. The orange-yellow oil so obtained was dissolved in isopropanol (255 ml) and (R)-(+)- $\alpha$ -

methylbenzylamine (5.43 ml, 42.57 mmol) was added, with stirring. Any solids which formed were redissolved by heating and the solution was allowed to cool in the freezer overnight. Several recrystallizations from isopropanol gave the title compound (7.19 gm) as a white solid which was identical to material prepared in Example 32, Method A, Step D.

Step D: Preparation of (R)- $\alpha$ -allyl-benzofuran-5-ylmethyl isocyanate

A solution of the material prepared in Step D above (470 mg, 2.2 mmol) and the material prepared in Example 22 (600 mg, 1.8 mmol) in Et<sub>3</sub>N (0.38 ml, 2.7 mmol), DMAP (5 mg) and CH<sub>2</sub>Cl<sub>2</sub> (5 ml) was stirred overnight at room temperature and then was heated at 40-50 °C. The reaction mixture was evaporated to dryness and the residue was purified by repeated chromatography to give 350 mg of the title compound (higher R<sub>f</sub> isomer).

This mixture was hydrogenated at 20 p.s.i. for 8 min, when tlc and NMR indicated complete reduction of the allyl group. The reaction was filtered and the filtrate was evaporated to dryness. The residue so obtained was dissolved in a mixture of cold CF<sub>3</sub>CO<sub>2</sub>H (5 ml) and anisole (1 ml) and the reaction was stored at 0 °C for 20 min before being evaporated to dryness. This crude product was purified by chromatography on thick layer silica gel plates developed with EtOAc/hexane/HOAc (35:64:1) to give 200 mg of the title compound.

50

To a solution of the material prepared above in Example 32, Method D, Step A (10.0g) in DMF (150mL) at 20 °C under a N<sub>2</sub> blanket was added 10% Pd on carbon (2.0g), followed by a 55% solution of ammonium formate in H<sub>2</sub>O (15.0mL). This mixture was heated at 45 °C for 30 min and then was cooled to 20 °C and filtered (washing the pad with 30mL of DMF). The filtrate was partitioned between 1N HCl (100mL) and EtOAc (200mL) and the organic layer was washed successively with 0.1N HCl (2 x 100mL) and brine (2 x 100mL) before being evaporated to dryness to give the title compound (free acid) as a pale yellow viscous gum (9.25g).

A slurry of the free acid prepared as described above (39.0g) and tris-(hydroxymethyl)aminomethane

This mixture was seeded (200mg) and allowed to cool to 20°C overnight. Hexanes (700mL) were then added and the slurry was aged at 5°C for 2 hr and the solid so formed was filtered, washed with isopropanol/hexanes (1:4; 80mL) and then dried in vacuo at 20°C 5 to give the title compound (29.9g).

Step A: Preparation of 4-hydroxy-2-methylbenzoic acid

4'-Hydroxy-2'-methylacetophenone (15 gm, 0.1 mol) was dissolved in pyridine and iodine (25.4 gm) was 15 added. This mixture was heated to 100°C for 1 hr and then allowed to stand at room temperature overnight. A thick precipitate was obtained and the mixture was diluted with Et<sub>2</sub>O before filtering. The solid so obtained was added to 5N NaOH (200 ml) and heated on the steam bath for 1 hr before being cooled and acidified with HCl. This mixture was extracted twice with Et<sub>2</sub>O and the pooled organic layers were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness. The residue was crystallized from Et<sub>2</sub>O - 20 hexane to give 9.8 gm of the title compound as a solid.

Step B: Preparation of benzyl 4-hydroxy-2-methylbenzoate

9.5 gm (63 mmol) of material prepared as described in Step A above was dissolved in DMF (100 ml) 25 and benzyl bromide (8.4 ml, 69.3 mmol) was added followed by powdered K<sub>2</sub>CO<sub>3</sub> (13 gm, 94 mmol). This mixture was stirred at 60°C for 2 hr and then was cooled, diluted with Et<sub>2</sub>O and poured onto ice chilled aq. HCl. The layers were separated and the aqueous layer was extracted twice more with Et<sub>2</sub>O. The pooled 30 organic layers were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness. This crude product was purified by flash chromatography (silica gel, using 10% - 30% EtOAc in hexane as eluant) to give the title compound as an oil which upon trituration with hexane and cooling gave 8.5 gm of a white solid.

This mixture was heated at 50 - 60°C for 3 hr and then poured into ice-chilled 2N HCl. The mixture was extracted twice with Et<sub>2</sub>O and the pooled organic layers were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered 40 and evaporated to dryness. This residue was purified by flash chromatography (silica gel, using 20% - 40% EtOAc in hexane as eluant) to give 5.3 gm of the title compound as a white solid.

The reaction mixture was then cooled and added to dilute HCl. The mix was extracted twice with Et<sub>2</sub>O and the pooled organic layers were 50 washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness. The residue was purified by flash chromatography (silica gel, using 10% - 20% EtOAc in hexanes as eluant) to give 150 mg of pure (4S)-3,3-diethyl-1-[(R)- $\alpha$ -allyl-(4-methyl)benzyl-aminocarbonyl-4-[(4-benzyloxycarbonyl-3-methyl)phenoxy]azetidin-2-one.
